

ABSTRACT OF THE DISCLOSURE

A mirror assembly is provided for use in "hitching" trailers to towing vehicles. The mirror assembly can be used for conventional ball and socket couplings, fifth wheel couplings and variations thereof. The mirror assembly is magnetically attached to the trailer tongue so it can be easily removed after coupling. The mirror assembly includes a telescoping stanchion mirror post and a swivel joint which can be vertically rotated. A ball joint connected to the back of the mirror allows the mirror to be turned in any of a variety of positions for precise alignment during the hitching process.
